

Vladimir Golubev

AI ARCHITECT / AI-AUGMENTED ENGINEER

Backend engineer → tech lead. I'm the one fuzzy specs go to die.

AI agents | OpenHands SDK | Claude Code | LLM fine-tuning | local LLMs | Python pipelines | backend architecture

Summary

Backend engineer turned technical lead — 13+ years building, scaling and owning production systems, with team-leadership and lead/architect responsibilities since 2018. I design high-load distributed backends and I'm accountable for the architectural decisions behind them.

PROOF POINTS

- A real-time **statistics / analytics core** I architected in 2016 is still running in production a decade later.

AI architecture with production engineering underneath. I design agentic pipelines, own the harness around them, evaluate model behaviour, and turn AI-assisted workflows into repeatable engineering processes. My focus includes tool use, LLM fine-tuning, local models and human approval at the points where correctness matters.

I validate these patterns in my solo studio at nomorecare.gg (<https://nomorecare.gg>): a web-novel design pipeline and a game-master pipeline, with the first version built on an agent framework. Engineering judgement remains the foundation: agents draft, systems validate, and the owner approves.

Open to AI Architect and AI-Augmented Engineer roles where agentic systems, model workflows and sound backend architecture meet. Remote-first, based in Novi Sad, Serbia. English C1, Russian native.

Work Experience

Senior Backend Engineer / Tech Lead — Quintegro · Jul 2022 – Jun 2026 · Remote Technical lead and senior backend engineer across a collectible-car ecosystem — multiple products: event-car rentals, US auction sites, an analytics platform, an RV marketplace. Served as tech lead on an event-car rental marketplace through its support phase; designed the seller-side deal-offer flow on an in-house PHP framework (PHP, jQuery, MariaDB). Applied an Agents Framework, Claude Code and AI process automation to the working workflow: agents prepare drafts and implementation context, while the owner reviews and approves the result. Agents Framework, Claude Code, AI process automation
Senior Backend Developer — Playkot · Jul 2021 – Jun 2022 · St. Petersburg Backend engineer on a live mobile-game backend under production traffic: implemented multi-provider authentication with account linking, and optimised partial-load / lazy-loading patterns over MongoDB for hot player data (performance optimisation under load).
Senior Backend Developer — Rabota.ru · Oct 2020 – Jun 2021 · St. Petersburg Backend engineer on one of Russia's largest job boards (high-traffic web platform): built the in-account customer notification service, migrated client-account features off a legacy codebase onto the new internal framework (legacy modernisation), and extended automated-test coverage across PostgreSQL-backed services.
Lead Backend (PHP) Developer — Smart Line · Apr 2015 – Oct 2020 · St. Petersburg Grew a small internal PHP utility into offergate.pro — a multi-tenant CPA (cost-per-action / affiliate marketing) platform with two product surfaces and a ClickHouse analytics stack. Designed a real-time statistics / analytics core in 2016 that still runs in production today; the platform API peaked at 7,000 requests per second (high-load system design).
Full-Stack Engineer — TAXOFT · Jan 2013 – Mar 2015 · St. Petersburg Designed, built and maintained the full software stack of a taxi-aggregator / ride-hailing service end-to-end — first hands-on exposure to production scale and on-call operations.

Projects

No More Care — Founder / Solo Engineer

nomorecare.gg → (https://nomorecare.gg)

Solo (one-person) indie game studio with three roguelike games in development — sole owner of design, software architecture, code, infrastructure and release. Used as a **real-world test bed for agentic AI / LLM-assisted (“AI-in-the-loop”) development workflows**.

AI pet projects include a pipeline for designing web novels and a game-master pipeline for running structured tabletop scenarios; the first game-master version is built on an agent framework and is evaluated as an engineering workflow, not a toy prompt.

NEAR RELEASE: **Terminal Stake** Stock-market roguelike with procedurally generated companies and hidden difficulty scaling. Pure terminal UI.

IN DEV: **Incrememory** Fast auto-battler roguelike with deep upgrade mechanics.

IN DEV: **Increvolution** Ecosystem-management roguelike with evolutionary mechanics.

Skills

PINNED

AI Architecture

Agentic AI

System Design

ai-augmented development Claude / Claude Code, ChatGPT, GitHub Copilot, Cursor, Codex, Agentic AI, LLM-assisted development, Agentic frameworks, OpenHands SDK, LLM fine-tuning, Local LLM setup: OpenHands SDK + LM Studio, Python pipelines

architecture & systems System design, Software architecture, Distributed systems, Microservices, Monolithic architecture, High-load / high-throughput systems, Scalability, Performance optimization, API design, REST APIs

languages & runtime PHP (5, 7, 8), JavaScript, SQL, Python (beginner, pipelines)

roles / seniority Technical Lead, Software Architect, Staff Engineer, Senior Backend Engineer, Engineering Team Lead

cloud & infra AWS, Docker, Terraform, CloudWatch, CI/CD, Linux, Infrastructure as Code

data ClickHouse, MySQL, MariaDB, PostgreSQL, MongoDB, Couchbase, DynamoDB, OpenSearch, Redis, NoSQL, Relational databases, Column-store databases, Database design

quality PHPUnit, Behat / BDD (behavior-driven development), Test automation, Technical documentation

leadership Technical leadership, Team leadership, Mentoring, Code review, Architectural sign-off / decision ownership, Release management

languages Russian (native), English (C1)
